Temporomandibular Arthrography

Temporomandibular joint dysfunction (TMD, TMJD) is an umbrella term covering pain and dysfunction of the muscles of mastication (the muscles that move the jaw) and the temporomandibular joints (the joints which connect the mandible to the skull). The most important feature is pain, followed by restricted mandibular movement, and noises from the temporomandibular joints (TMJ) during jaw movement.

Temporomandibular Disorders - Medical Clinical Policy ...

Temporomandibular joint (TMJ) dysfunction is a common condition that is best evaluated with magnetic resonance (MR) imaging. The first step in MR imaging of the TMJ is to evaluate the articular disk, or meniscus, in terms of its morphologic features and its location relative to the condyle in both closed- and open-mouth positions.

Magnetic resonance imaging is the most useful and widely used imaging modality for the evaluation of the temporomandibular joint (TMJ). Compared with computed tomography (CT) and arthrography MRI provides better tissue contrast for the visualization of soft tissue and other articular structures of the TMJ.
